

Exercise 1 – Use the Linux Shell Safely

Summary of the work completed during the Linux shell exercise.

Task 1 – Find Your Way in the Terminal

- Used pwd to check the current location.
- Used ls to see files and folders.
- Used cd to move between folders.
- Checked the location again with pwd.

Task 2 – Create Folders

- Created shell_training.
- Entered the shell_training folder.
- Created docs, tests, and backup.
- Checked the folders with ls.

Task 3 – Create and Show Files

- Created notes.txt and todo.txt.
- Practised creating/editing files.
- Used cat to display file contents in the terminal.

Task 4 – Copy and Move Files

- Copied notes.txt into backup.
- todo.txt must be moved into docs to satisfy the exercise sheet.
- cp means copy: the original remains in its original location.
- mv means move: the file changes location.

Task 5 – Clean Up Carefully

- Created a test file.
- Deleted only the test file.
- Checked afterward with ls.
- Safety rule: Always check the exact filename before using rm.

Extra Practice

- Practised moving between folders and checking paths with pwd.
- Practised reading terminal error messages and correcting commands.
- The exercise sheet does not require creating a ZIP archive.

Reflection

- Helpful commands: `pwd` and `ls`, because they show where I am and what is in the current folder.
- Be especially careful when using `rm`.
- A path is the location/address of a file or folder in the Linux filesystem.

Status: Exercise 1 is essentially complete. To match the sheet exactly, confirm that `todo.txt` has been moved into `docs`.
